Description

Mesh panels commonly known as anti-gawking screens are used on civil work sites and construction sites to reduce the visibility of the sites activities to the general public and to pedestrians or vehicles passing by. Reducing visibility on roadside work zones provides safety for road uses. Drivers often become distracted by roadwork and this can lead to hazardous situation for both drivers and workers. Anti-gawk screens can also play an important role in promoting your business, brand or project, with the use of printed banner mesh or shade cloth which is easily attached to the mesh panels.
