

Temp Fence F-Frame Brace

Product Images

Short Description

Heavy duty temporary fence panel F-frame bracing. Greatly increasing the strength and stability in long runs of perimeter fencing.

Description

Bracing is an essential part of a sturdy temporary fencing system. It adds an extra element of safety and stability, and ensures your fencing is well balanced and will not topple under light stress such as wind or

workers leaning on the fence.

Jaybro's fencing team can provide specialist advice and assistance in calculating the kind of bracing you may need for your site, as well as the quantity.

This F-Frame support frame is used instead of the standard brace where the fence is installed in an extreme wind area, or where shade cloth is installed. The F-Frame requires two heavy duty couplers (supplied), and can fit up to 4 feet.

For more information on when and how to brace your temporary fence, check out our tips on [bracing temporary fences](#).

Features:

- Adds safety and stability to your temporary fence
- Requires 2 x heavy duty couplers (supplied)
- Works with up to 4 fence feet
- Galvanised for strength and corrosion resistance
