

Raised Reflective Pavement Marker - White

Product Images

Short Description

Raised reflective pavement markers or 'Cats Eyes' measure 100 mm x 75 mm. These white RRPMS come with a reflective strip on one side.

Minimum purchase of 50 markers

Description

Raised pavement markers (RPMs) or delineators are a safety and visibility device used on roads. These white reflective markers measure 100 mm x 75 mm and offer excellent visibility to oncoming motorists via the reflective material that reflects car headlights. White raised pavement markers identify that the dual carriageway is travelling in one direction only. Jaybro also stocks yellow and red raised pavement markers. Yellow raised pavement markers are usually used to warn motorists that the road is a dual carriageway, whilst red markers are used at the side of the road.

Raised Reflective Pavement Markers or RRPMS are made for durability and high traffic situations. The lightweight plastic construction is strong and highly retroreflective and their raised profile means they can do double duty as a rumble strip for added motorist awareness for lane drifting.

The markers provide highly effective visibility even at night or during rain. White raised pavement markers can be easily fixed to asphalt pavements with a strong adhesive.

We recommend a strong adhesive such as [Megapoxy](#), or alternatively [self-adhesive butyl tar pads](#).

Minimum purchase of 50 markers
