

mastaTEX Coterotex Non-Woven Heavyweight Geotextile Liner

Product Images

Short Description

Designed for use in landfills as a liner cushion, and in coastal applications for erosion control and rock armour protection. Available in 600, 900 or 1200gsm fabric weights.

Description

mastaTEX Coterotex geotextiles are a specialist heavy weight geotextile designed specifically for use in landfills as a liner cushion, and in coastal applications for erosion control and rock armour protection.

Liner Protection: CoterotEX geotextiles are suited for use in landfills as a protection layer for polymeric liners, preventing liner damage and reducing the risk of soil contamination.

Separation – Available in a range of weights, CoterotEX is ideal as a separation layer preventing different materials from mixing, and maintaining the performance of the individual layers. Due to the robustness of this geotextile, it is suitable for use in separating a lot larger rock fill than traditional geotextiles.

Coastal Protection – Due to the resistance to harsh environments, CoterotEX is the geotextile of choice when retaining sand or soil which is subject to constant water movement. Used both as a surface layer and under rock revetments, CoterotEX is UV stabilised and will retain its strength and robustness properties in tough environmental conditions.

Applications:

- Liner protection
- Separation
- Coastal protection

Additional Information

CODE	GFCT-WP
Brand	GEOmasta
Material	Polypropylene
Width	6 m

Product Options

Type:	1200 gsm
	600 gsm
	900 gsm
